

An elevator button in your pocket

eCall brings an intuitive elevator interface to users' smartphones, allowing them to place elevator calls remotely from anywhere within the building.

Go Mobile

Once a user is inside the building, the eCall app connects to the Gen2® elevator using the phone's cellular network or the building's internet.

Reduce The Wait

eCall allows users to place elevator calls as they approach, while the anti-nuisance feature limits the rapid succession of calls to 3 every 5 minutes.

One For All

One app can be used with multiple buildings, with separate registration required for each building.

Easy Access

eCall features an accessibility mode, which can be turned on to extend door dwell times.

Simple Download

eCall can be easily downloaded for free from the appropriate online app marketplace.

Simple Registration and User Management

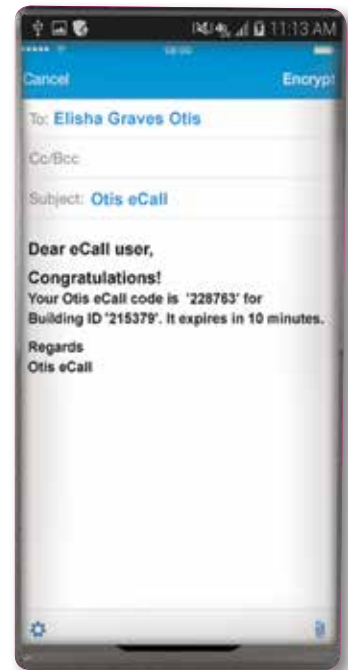

User registration is easy and intuitive. Building managers can choose whether they prefer user self-registration or management-controlled registration through the eService customer portal.

User Self-Registration

Users are prompted to enter the designated Building ID and email address before pressing send. An activation code is sent via email, which users will enter to complete the registration.

Activation Email Message

Management-Controlled Registration

Using the eService customer portal, building managers can set-up and manage access using tenants' email addresses. Users then complete the registration before the eService customer portal authenticates them, giving users access to the app. Building managers can remove or add users at any time.
